C INTERNAL REFERENCE · CELESTE DAILY

CELESTE INTELLIGENCE

A guide to the AI business-intelligence layer running over Celeste Daily's live order, inventory and customer data. Four ways in: a daily **briefing** of what Celeste found, a reference **dashboard**, a **Next Order** page for customer and stock predictions, and **Ask Celeste** for anything not already on a page.

Scope 5 Celeste Daily outlets **Data window** starts Feb 2026 **Refresh** once nightly, 05:00

Chat tools 25+

01 · EVERY VISIT

Home

What Celeste found today — proactive findings, ranked by impact.

02 · REFERENCE

Dashboard

Cross-store numbers to check when you already know what you're looking for.

03 · CUSTOMERS & STOCK

Next Order

Who's due to order, what they'll likely buy, and whether stock will cover it.

04 · ANYWHERE

Ask Celeste

Ask a plain-language question; Celeste picks the right tool and answers.

01

HOME — BUSINESS BRIEFING

Opens to what changed, not a wall of numbers. This is the page to check every day.

Every night at 05:00, Celeste re-scans the whole business — sales, cancellations, delivery, stock, and margin — and writes down what it found. Home shows that list, freshest first, so the question it answers is always *"what does today's team actually need to know?"* rather than making you go hunting through charts.

BUSINESS HEALTH STRIP

One overall score plus a score for each domain (Sales, Operations, Inventory, Customers), each with a real day-over-day change — not a snapshot with no memory. A domain with no prior score yet (the very first day) says so honestly instead of showing a fabricated "no change."

WHAT CELESTE FOUND

Severity tiles

Findings are counted into Critical / High / Medium / Positive, from the same magnitude Celeste already measured — not a guessed label.

Business Impact, ranked

The 4–5 findings most worth attention, scored by how severe and how persistent (one-off blip vs. a real multi-day trend) each one is.

Finding journey

Each finding moves through New → Action required → In progress → Monitoring → Resolved — combining what your team logged with what Celeste verified actually happened.

Long-term / This week

Monthly structural findings sit apart from short-term (trailing 7-day) operational ones like a cancellation spike — different questions, different tab.

EVERY FINDING, EXPANDABLE

Cards open collapsed — headline, current value, a small trend line — and expand into the full story: **Why** this is happening, **what happens next** if nothing changes, **what to do** about it, and a place to mark it relevant, assign who's on it, and track status. A month later, Celeste checks on its own whether the metric actually recovered and records improved / worsened / unchanged — no one has to remember to follow up.

02

DASHBOARD

Reference numbers — for when you already know what you want to check, not for discovery.

Home is where Celeste tells you what matters. Dashboard is where you go to look something up yourself: cross-store comparisons and category-level reference data that don't need a finding to justify their own space.

Business health, by domain

The same scoring Home's strip uses, shown as full domain bars.

Store performance

All 5 outlets side by side, outliers pill-coded rather than buried in a plain table.

Inventory value

Stock split into dead / overstock / healthy, by value.

Customer segments

Active, repeat, at-risk and churned customers at a glance.

Products & categories

Department revenue mix and top-selling products.

Orders by hour, profitability

Order-volume rhythm across the day, and a revenue → COGS → gross profit → discounts breakdown (flagged as ~87% cost-data coverage, not exact).

03

NEXT ORDER

Customer Purchase Intelligence — when each repeat customer will likely order again, what they'll likely buy, and whether the business can supply it.

Everything on this page is built from each customer's or product's **own** history — never a single company-wide rule applied to everyone. A customer who orders every 3 days and one who orders every 20 are judged against their own pattern, not the same clock.

ORDER FORECAST `company-wide & by outlet`

A line chart of actual daily order counts running into a predicted count for the next 5 days — solid where it's measured, dashed where it's a forecast. The same forecast is then split across your 4 currently-trading outlets by each one's real recent share of order volume (Ja-Ela currently shows no forecast — it's had zero orders in the last 30 days, a real state, not missing data).

STOCK & OUTLETS `top sellers, not a company total`

A single company-wide stock number can't say whether any specific product will run out — it pools thousands of SKUs together. So this section checks the **top 15 best-selling products** against their own sales rate and flags anything under 3 days of cover, plus a separate breakdown of out-of-stock and low-stock counts for each of the 4 active outlets.

```
short = days_of_cover < 3
```

Not a 10-day rule — most top sellers here are fresh produce and dairy, restocked almost daily by design. A 10-day requirement would flag every single one as short when thin stock is normal for a grocer like this.

CUSTOMER PATTERNS

SECTION	WHAT IT ANSWERS
Executive summary	How many customers Celeste can predict for, how many are due or overdue, expected orders and revenue.
Purchase pattern	How much order history backs each prediction — high confidence (10+ orders) down to not enough history yet.
Customer lifecycle	Every customer sorted into New / Active / Due / Lapsing / Churned / Win-back / Dormant / Excluded, plus which delivery channel (Uber, PickMe, Direct) churns more.
Outlet-wise behavior	Order count, cancellation rate, unique customers and average order value, per outlet.

Customers table	Every predictable customer, searchable and sortable — expand a row for their full cadence story.

LIKELY NEXT ORDER `per customer`

Expand any customer row and Celeste lists which of **their own** regularly-bought products are due for reorder — not a generic recommendation, their actual repeat items, ranked by how overdue each one is. About half of predictable customers have a product bought often enough to support this; for the rest, the page says so honestly instead of guessing.

04

ASK CELESTE

Available from every page. Ask in plain language; Celeste picks the right tool itself.

Not a fixed list of report buttons — a chat agent that calls real backend tools to answer. Covers ground the 3 pages don't have room for:

- **Sales & margin** — revenue, gross margin, average order value, by any period or store.
- **Channel & cancellations** — Uber / PickMe / Direct split, cancellation reasons, delayed deliveries.
- **Product lookup & basket analysis** — one item's numbers, or which products sell together.
- **Loyalty & promotions, brand/department mix, loss & damage** — points issued/used, real promotion discount value, shrinkage by reason.
- **Suppliers** — fill rate, price variance, and how concentrated purchasing is in one supplier.
- **Investigate any metric** — the same anomaly + trend engine behind Home's findings, on demand for whatever you ask about, both monthly and trailing 7-day.

Conversation history is kept per session so you can follow up without repeating context.

HOW CELESTE DECIDES THINGS

The same handful of rules run underneath every page. Worth knowing, since they're why the numbers can be trusted.

- **Personal, not universal, thresholds.** "Overdue" for a customer or "short" for a product is measured against that specific customer's or product's own history — never one flat number applied to everyone.
- **Checked against real data before shipping.** Every rule on these pages — including the 3-day stock threshold and the outlet-split method — was verified against actual order and stock history first, not assumed correct from the design alone.
- **Approximations are labeled, not disguised.** Where a number is estimated (an outlet's forecast share, required stock from an average) or held flat because real history doesn't exist, the page says so directly.
- **Data problems are surfaced, not hidden.** Bulk-buyer accounts, an outlet with zero recent orders, a product with negative recorded stock — all get flagged in place rather than quietly smoothed over.

WHAT'S NOT BUILT YET

Named plainly so nobody assumes a gap is a bug.

Data gap	Year-over-year comparison isn't possible — the business's data starts Feb 2026, so there's no prior year to compare against.
Data gap	Delivery speed in minutes, and commission/delivery cost per order, aren't tracked anywhere in the source system.
Data gap	Perishable expiry / shrinkage risk can't be measured — the shelf-life field in the source data is essentially empty.
Known gap	The Next Order engine isn't yet scoped to only the 5 real outlets — about 20% of the orders behind it come from co-located partner storefronts (SPAR, Budget Kade).
Known gap	The Customers table's on-track/due/overdue counts and the Customer Lifecycle counts don't yet reconcile exactly — both are real, they just apply the "New customer" carve-out slightly differently.
Not built	Order-value prediction, and next-order product suggestions beyond a customer's own repeat items.

WHAT'S NEXT

Data ready

Which customers respond to promotions

Real discount and loyalty-points data already exists; not yet analyzed at the individual-customer level.

Proposed

Order-value prediction

Not just when a customer orders, but roughly how much they'll spend.

Proposed

Deeper fulfillment quality per customer

Whether an at-risk customer is leaving because of cancellations/delays specific to them.
